# DESCRIPTIVE CATALOGUE OF DAFFODILS

AND

EPITOMIZED LIST OF HARDY BULBS AND PLANTS.

## SULPHUR HOOP PETTICOAT DAFFODIL

(*Narcissus corbularia citrina*).

"It is a bold and shapely flower of a soft sulphur tint, the colour having a luminous quality, the flower being like a little lamp of pale yellow light."

Extract and Illustration from "The Garden,"  
17th March, 1883.

## BARR & SON,

(Formerly BARR & SUGDEN),

Please write Order on marginal ....., and, after filling in name and address, kindly use accompanying envelope.

### PARCELS POST TO ALL PARTS OF THE UNITED KINGDOM.

We shall, when advantageous, use this mode of transit, the articles ordered being under seven pounds, and admitting of safe transmission by "*Parcels Post.*" Plants and heavy packages shall, as hitherto, be sent by Rail, and carriage may be deducted at settlement of account. Orders paid in advance, if sent by Rail, carriage will be prepaid, or a liberal equivalent in goods added. *This latter course will be adopted if we are not otherwise instructed.*

Forward the articles marked on the margin of this List per \_\_\_\_\_  
 Railway to \_\_\_\_\_ Station, and charge them to the  
 account of \_\_\_\_\_  
 Postal Address \_\_\_\_\_  
 Signature of person ordering \_\_\_\_\_  
 Date \_\_\_\_\_ 1883.

### DAFFODIL, OR NARCISSUS.

The most beautiful of all Spring flowers is the Daffodil, and its hardiness is beyond all question. The older kinds have withstood uninjured our severest winters for centuries; and the new ones now offered have remained uninjured in the open ground during the late series of severe and protracted winters. Its blossoms withstand frost, snow, rain, and wind, longer than any other spring flower, and this was observed by Shakspeare, when he wrote—

"Daffodils,  
 That come before the swallow dars, and take  
 The winds of March with beauty."

THE ALDBOROUGH COLLECTION OF DAFFODILS, of which we are the fortunate possessors, is the most complete and unique set of hardy Daffodils ever brought together by an amateur, and exhibit in a most marked degree the industry and enthusiasm of their cultivator, the late lamented eminent horticulturist, the Rev John Nelson, of Aldborough Rectory. The collection is represented by nearly 150 sorts, embracing almost all the kinds known to amateur horticulturists of the sixteenth, seventeenth, and eighteenth centuries, and to Salisbury, Sweet, Haworth, Herbert, and Baker of the present century, and, in addition to these, the recent new hybrid varieties which rank in point of beauty with the magnificent orchids which have been brought into cultivation within the last few years. These new hybrid Daffodils are the result of crosses between the different varieties of the Trumpet Daffodil and the varieties of Poeticus on the one hand, and the Trumpet Daffodil and Montanus on the other. Unfortunately, the gentlemen who produced such wonderful results, and made so many grand additions to a family already rich and varied, have left on record so little data, that we can but surmise how the work was accomplished. However, we know for certain that a cross between the Trumpet and Poeticus Daffodils gives *Incomparabilis*, *Parkinson's Peerless Daffodil*. Assuming, therefore, that this result is followed by crossing *Incomparabilis* and Poeticus, what is more natural to expect than Barri, which is simply a reduced *Incomparabilis*. Then again cross Barri and Poeticus, and we imagine the outcome would be Burbidgei, which is a Poeticus with the crown somewhat larger and retaining the colours of the first hybrid, viz., *Incomparabilis*. The Eucharis-like Daffodil, Leedsi, we think most likely a cross between Trumpet Albicans and Montanus. The most perfect of all hybrid Daffodils, viz., Nelsoni, would, we think, result from a cross between Trumpet Bicolor and Poeticus, or Macleai possibly assisted, as the Nelsoni's are large forms of Macleai, the most perfect of miniature Daffodils; besides the foregoing results in the production of hybrids there is amongst the new Daffodils of the Trumpet section great variety both in size and colour, which we conclude to be the result of seeding the varieties of the Magni-coronate Group.

A remarkable feature in many of these hybrid Daffodils is the strongly marked orange-scarlet crown, which we imagine would come from Poeticus poetarum; and others, again, have the crown dark yellow, light yellow, canary-yellow, primrose, silver-white, and some apricot-coloured. The late Mr. Nelson raised a few seedling Daffodils of considerable character, and had he lived a few more years, he doubtless would have made valuable additions to this family. The Rev. Wolley Dod has for some years past been forming a collection of Daffodils; we hope he will bring some of his energy to bear on the hybridization of this family, and from his personal experience tell us how all these beautiful modern varieties were made. Two Coloured Plates of New Daffodils issued with *The Garden* represent some of the hybrids alluded to above, and those who are desirous of acquainting themselves with the interesting literature of the Daffodil, and the monographs which have been written of this family, should purchase Burbidge's admirable work, which is beautifully illustrated, and written in a most charming style.

"It has been observed," says Mr. Burbidge, "that these beautiful Daffodils are never seen to better advantage than when planted on the moist margins of lakes and streams, or islands, where their golden nodding flowers contrast with the cerulean reflection in the limpid water below."

This seems also to have occurred to Keates, who, in one of his beautiful poems, asks—

"What first inspired a bard of old to sing  
 Narcissus pining o'er the untainted spring?"

Shelley speaks of the Daffodils thus—

"And Narcissi, the fairest among them all,  
 Who gaze on their eyes in the stream's recess,  
 Till they die of their own dear loveliness."

Wordsworth pays a graceful tribute to the Narcissus—

"When all at once I saw a crowd  
 A host of golden Daffodils,  
 Beside the lake, beneath the trees,  
 Fluttering and dancing in the breeze."

#### THE MOCK-DAFFODIL WITH CHALICE-SHAPED CROWN.

GROUP II.—Medii-coronatæ of Baker, Queltia, Philogyne, etc., of Haworth, Peerless, Nonsuch, etc., of Parkinson.

DISTINGUISHING CHARACTER.—Crown half as long as the divisions of the perianth, but in one or two cases three-quarters as long.

It is pretty generally supposed that the varieties in this group are hybrids (excepting, perhaps, Juncifolius). It is true, Incomparabilis is found wild in France and Spain, but Dean Herbert and others have produced it by crossing Poeticus with a Trumpet Daffodil. Maclean is considered by Baker between a Tazetta and a Trumpet Daffodil. Although we have no positive data as to the parentage of the new hybrids described in this group, we think it may fairly be assumed that Poeticus and the Trumpet Daffodils gave all the varieties of Incomparabilis, which have always the crown yellow; Poeticus or Montanus, with Cernuus or Albicans, gave the varieties of Vincetti, which have the perianth white, or sulphur-white, and the crown always canary-yellow. The same cross would give Leedsii "the Eucharis-like Daffodil," which has the perianth white, and the crown white, or primrose, changing to white. Poeticus and Bicolor would give Nelsoni. Poeticus and Incomparabilis would give Barri, which may be considered a small Incomparabilis.

The varieties in this group commence flowering in March and furnish a succession till May.

THE SMALL-CROWNED DAFFODIL, OR TRUE NARCISSESS.

GROUP III.—Parvi-coronatae of Baker; Hermione and Helena of Haworth; the Primrose-Peerless and Purple-ringed Daffodils of Parkinson.

DISTINGUISHING CHARACTER.—Crown less than half as long as the divisions of the perianth.

In this series Poetieus is considered the true Narcissus; Biflorus is Parkinson's Primrose-Peerless, a supposed hybrid; Burbidgei is a hybrid belonging to the new Narcissus, and is the connecting link between Groups 2 and 3. We assume that Poetieus and Barri gave Burbidgei. (See Coloured Plate in "The Garden," 1880.)

The early Poetieus commences flowering in March, and the late-flowering close the Daffodil season towards the end of May. Gracilis with the Double White, Gardenia-flowered Daffodil, Poetieus plenus, are the last to bloom.

**POLYANTHUS NARCISSUS (BUNCH-FLOWERED DAFFODIL) FOR POT CULTURE AND OUT OF DOORS.**

The rich golden-yellow and snow-white flowers of the Polyanthus Narcissi during winter and spring, form a pleasing variety in the decoration of the conservatory and sitting-room. One to three bulbs may be grown in a pot. Culture the same as recommended for the Hyacinth, page 7. For flower garden decoration plant so that the base of the bulb is at a depth of 9 to 12 inches from the surface.

**CHIONODOXA LUCILIAE (The Glory of the Snow).**

.....Chionodoxa Luciliae (The Glory of the Snow). Mr. Maw, in describing the circumstances under which he found the Chionodoxa Luciliae, says, "At the lower level it was out of flower, but near the summit of the mountain a mass was met with in full splendour, forming one of the most sumptuous displays of floral beauty I ever beheld; a mass of blue and white resembling Nemophila insignis in colour, but more intense and brilliant." The Chionodoxa Luciliae was beautifully figured in *The Garden*, July 3rd, 1880, and in 1878 the Floral Committee of the Royal Horticultural Society awarded to our specimen a First Class Certificate. Collected roots, per 1000, 1st size, 120s.; 2nd size, 100s.; 3rd size, 80s.; per 100, 21s., 15s., & 10s. 6d.; per doz., 3s. 6d., 2s. 6d., & 1s. 6d. Extra sized roots for pot culture, per doz., 5s. 6d.

.....Chionodoxa sardensis; this beautiful species we offer for the first time. Our correspondent informs us the roots were gathered close to the ruins of the ancient town of Sardis, at an elevation of 4000 to 5000 feet. The flowers he describes as larger and more numerous than those of C. Luciliae, and, with the exception of a very small white eye, are of a rich uniform intense Nemophila-blue. Collected roots, per 100, 1st size, 42s.; 2nd size, 30s.; 3rd size, 21s.; per doz., 7s. 6d., 5s. 6d., & 3s. 6d.; extra sized roots for pot culture, per doz., 10s. 6d.

The annexed illustration of Chionodoxa Luciliae, and the following remarks, are from *The Garden*, June 7, 1879:

"The Chionodoxa Luciliae is, without doubt, the finest addition that has recently been made to our list of hardy spring-flowering dwarf bulbous plants. Its habit at once reminds one of the two-leaved Squill (*Scilla bifolia*), as it rarely develops more than a pair of leaves. The blossoms, from five to ten in number, are produced on gracefully arched stems, from 4 to 8 inches high, and are each nearly one inch across, star-like in form, and of a beautiful blue tint on the outside, gradually merging in to pure white in the centre. As to the hardiness of Chionodoxa Luciliae there can be no doubt, as it has withstood the past trying winter with impunity, and flowered freely during March and April."

Established bulbs of Chionodoxa Luciliae have from 10 to 20 blossoms on a spike. The new species, C. sardensis, is even more floriferous.

**SNOWDROP (GALANTHUS NIVALIS).**

The Snowdrop is most generally used as a permanent edging, and in masses. In lawns and pleasure parks, dotted about in tufts, it looks charming nestling in the grass. When planting the Snowdrop in grass, the turf need not be disturbed, but holes five inches deep should be made with a dibber, dropping in two inches of fresh

soil, then three or more bulbs, keeping the holes about three inches apart. Snowdrops planted on banks and grass slopes are beautiful.

.....**GALANTHUS ELWESII** (Elwes' Giant Snowdrop), a distinct and beautiful species from the mountains near Smyrna, per 1000, 1st size, 120/-; 2nd size, 100/-, and 3rd size, 80/-; per 100, 21/-, 15/-, and 10/-; per doz., 3/6, 2/6, and 1/6.

The illustration of *Galanthus Elwesii* and the remarks upon it are from "The Garden," 1st April, 1876; shortly after Mr. Elwes had introduced this valuable Snowdrop, and before the plant was sufficiently established to show its true character. The sepals are broader, and the unopened flower larger and more globose in form than represented by the Woodcut.

**ELWES' NEW SNOWDROP**  
(*Galanthus Elwesii*).

"We recently saw this fine form of Snowdrop in Mr. Barr's bulb grounds at Tooting, from whence flowers were obtained from which our engraving was prepared.

"It is, perhaps, the finest of all our Snowdrops, its nearest ally undoubtedly being *G. Imperati*, but in that variety the conspicuous green blotches at the base of the three inner segments of the perianth characteristic of *G. Elwesii*, are wanting.

"It may be at once distinguished from the common Snowdrop by its larger size, and from *G. plicatus* by its more glaucous unplaited leaves.

"As a garden plant this Snowdrop will be most welcome when more plentiful, not only for planting in patches among the herbage, on outlying portions of the lawn, or wherever the less conspicuous common form is usually to be found, but also for use in bouquets, and for decoration. The bold and finely moulded outer segments are of crystalline whiteness, and the flowers of it which we obtained for sketching kept perfectly fresh for more than a week in a glass of water. Nothing could look prettier than they did, their snowy segments contrasted with violets and a few sprays of Maiden Hair Fern."

When above was written, bulbs of *Galanthus Elwesii* were being sold at 10s. 6d. each; now they are cheap. See above for price per 1000, 100, and dozen.

**FUNKIA, OR THE PLANTAIN LILY.**

These handsome ornamental-foliaged Japanese hardy plants develop their leaves early in Spring, and in Summer and Autumn, throw up a profusion of fine Lily-like flower spikes.

..... 6 in 6 vars., 3/6 & 5/6; 12 in 12 vars., 7/6 & 10/6

**IRIS.**

The Iris is the "Orchid" of the flower garden; its blossoms are the richest and most diverse in colour, and varied in form of hardy plants. It should be extensively planted in flower and shrubby borders; also for naturalization and in wild gardens. The varieties of Flag Iris, when established, require no further care. The varieties of Bulbous Iris in light well drained soils increase rapidly.

To cut for filling vases and for table bouquets, all the Iris are admirably adapted, and when necessary to forward the flowers to a distance, gather the buds just before expanding, and, like the Gladioli, they will open in water. The effect is greatly enhanced when the individual blossoms are arranged in wet sand or moss, or on a bank of wet moss.

**ENGLISH IRIS (THE LARGE BULBOUS IRIS OF SPAIN).**

This magnificent Iris thrives best in well-drained soil; when planted in heavy soil surround the bulbs with sand. When convenient plant as soon after the beginning of September as possible, although we have planted as late as December, and even in January; but the earlier the planting is done the better. The varieties described are distinct, and as strikingly beautiful and varied in colour as the most sumptuous orchids of the hot-house.

We exhibit annually cut flowers of this grand Iris at the Meetings of the Royal Horticultural Society, &c.

.....3 each of 12 ditto	.....	8 6	.....Named varieties, mixed	....." 12/6 "	2 0

**SPANISH IRIS (THE SMALL BULBOUS IRIS OF SPAIN).**

The Spanish Iris are in flower a fortnight before the English, and differ considerably, the flowers being smaller, and the combination of colours quite different; the blendings of the colours are more curious, and in this respect may be compared with the more rare of the curiously coloured orchids. They require the same cultural treatment as the English Iris. See coloured plate in *The Garden*, 1881.

We exhibit annually cut flowers of the Spanish Iris at the Meetings of the Royal Horticultural Society.

IRIS KEMPFERI (the Clematis-like-flowered Japanese Flag Iris).

CULTURE.—A naturally good adhesive, moist, loamy garden soil, laying well to the sun suits this plant. For example, on the moist Bagshot soil, in Mr. Stevens' garden the plant makes very strong growth, and flowers with remarkable freedom. When a soil has to be specially prepared, we recommend leaf soil, loam and peat in equal parts; but manure should not be given unless thoroughly decomposed or as a liquid. *We are of opinion that the Iris Kæmpferi is semi-aquatic, and would recommend those who have the opportunity to try it as such.*

The six NEW DUPLEX IRIS KEMPFERI described, we feel sure, will give the greatest satisfaction. For the six, 18s., or 3s. 6d. each.

- .....Prince of Wales, S. lilac, tinted violet, F. white, reticulated violet with conspicuous yellow spot.
  - .....Princess of Wales, S. white, tinged violet, F. white.
  - .....Princess Mary of Cambridge, S. and F. crimson tinged violet, and feathered white all over the surface.
  - .....Duke of Teck, S. and F., purple, speckled white, having a conspicuous yellow spot with halo of sky blue.
  - .....Duke of Albany, purple, shaded violet, the surface profusely speckled.
  - .....Duchess of Albany, rich purple, spotted white with conspicuous orange spot.
- .....In addition to the above six new varieties of Iris Kæmpferi we have many others, ranging in price, each 1/6, 2/6, 3/6, & 5/6

DWARF IRIS, INCLUDING PUMILA, OLBISIENSIS, Etc.

IRIS BARBATA, THE BEARDED IRIS, COMMONLY CALLED GERMAN OR FLAG IRIS.

Our collection of this Section of Iris has been pronounced the most complete in England, and in "THE GARDEN" of August 20th, 1874, a lengthened, classified, and descriptive list is given of the varieties we have flowered. In colours there are flowers of the richest yellows, the most intense purples, the most delicate blues, the softest mauves, and the most beautiful claret-reds. There are whites, and primroses, and bronzes of every imaginable shade—indeed, language fails us in picturing the beauties of this flower; in many of the varieties will be found 10 to 20 different shades harmonizing and blending in such a manner as to make one perfectly enthusiastic. Those who have not used the varieties of Iris Barbata for surrounding artificial lakes and ponds, or cultivated them in the flower borders, shrubberies, woodland walks, and wild gardens, should do so.

BEARDLESS SPECIES OF FLAG IRIS.

The Iris offered in this section are perfectly hardy, and altogether distinct from the Barbata group. Most of them make grand aquatics, especially *Aurea*, *Monneri*, *Ochroleuca*, *Goldensadtii*, the varieties of *Pseudo-Acornis*, and *Spuria*, which in water are not only majestic in growth, but have flowers surpassingly beautiful. The varieties of *Sibirica*, including *Orientalis*, are graceful in water. All the other Iris in this group, with the exception of *Cristata*, *Iberica*, *Kuthenica*, *Stylosa*, *Susiana*, *Tectorum*, and *Tuberosa* may be grown as marsh plants. *Cristata* is charming when grown on banks and rock-work in sunny sheltered places; *Iberica* and *Susiana* require special treatment. Dr. Foster, who grows these successfully, has them planted in a frame, and from the middle of June to the middle of October, all moisture is excluded. From October till in flower the lights are removed and the plants exposed to all weathers. From a very small space Dr. Foster cut this season a large quantity of the finest flowers of *Iberica* we ever before saw. *Fetidissima* is valuable for damp shady situations, and is prized for its seed vessels; *Tectorum* is found on the thatched roofs of Chinese houses.

IXIAS, SPARAXIS, TRITONIAS, AND BABIANAS.

CULTURE IN-DOORS.—From September to December plant in a five-inch pot five or six bulbs, using a compost of turfy loam, leaf soil, and silver sand. Make the soil firm about the bulbs, then plunge the pots in ashes in a cold pit or frame, and withhold water till the plants appear, then give sparingly at first. Except during wet or frosty weather, the lights should be left off. Early in February, the plants having made sufficient growth, remove them to the greenhouse, and carefully attend to the watering.

CULTURE OUT-DOORS.—Plant from October to January, at a depth of three to four inches, and two to three inches apart, in a prepared light loamy soil, thoroughly drained, the bed raised a few inches above the general level, with a due south aspect. Should the earlier plantings make foliage in autumn, protection must be given during severe frost, and this is best done by hooping the beds over, and, when necessary, covering with mats; or Tiffany may be used, and can remain on till the danger from severe frost has passed. The plantings made in December and January need no protection beyond a little fern, which gradually remove in spring as the plants spear through it; as these late plantings will flower later in summer than the earlier ones, select a situation for them where the sun's rays will be somewhat broken, and the blooming period will thereby be prolonged.

**THE RANUNCULUS.**

**CULTURE.**—Plant the Turban Ranunculus from October to March, and the Persian varieties from January to April. It is in a somewhat moist soil which has been trenched deeply that the Ranunculus does best, but any good loamy soil, which has been properly prepared, will do. When the soil works kindly, and the day is dry, draw drills two inches deep, and five or six inches apart; at the bottom of the drill sprinkle a little sand, press the tubers firmly into the soil, claws downwards, and cover with sand, then with soil, keeping the crown of the tuber two inches under the surface. Cover the early plantings with dry litter, leaves, or old tan during severe weather, and this remove before the foliage in Spring gets injured. In April and May, during dry weather, water the beds freely two or three times a week, and when the flower-buds appear; water if necessary daily, and continue doing so while the plants are blooming, taking every care not to wet the foliage if possible.

**DOUBLE PERSIAN RANUNCULUS FOR BEDS, RIBBONS, AND MASSES.**

The named varieties have been selected on account of their large flowers and fine colours.

**OUR OWN SELECTIONS.**

**THE ANEMONE, OR WINDFLOWER.**

**CULTURE.**—Any good soil, moderately well drained, suits the Anemone. In its native habitat it grows mostly in vineyards and oliveyards, where it is partially protected from the sun's rays and parching winds, the most potent enemies of Spring flowers. Plant in succession from August to May, the roots four to six inches apart, and at a depth of two to three inches; this should be done when the ground is in good working condition and on a dry day. *The planting for Summer and Autumn-flowering must be in a situation where the ground is moist, and in shade from 10 or 11 a.m.*

**SINGLE POPPY ANEMONES, OR WINDFLOWER.**

These handsome Single Anemones have large beautiful saucer-shaped poppy-like blossoms, and during mild seasons, or in sheltered situations, are flowering continuously throughout the Winter, Spring, and early Summer months.

..... Fine mixed, 3/6 per 100; 0/8 per doz.		..... Brilliant Scarlet Varieties, 4/6 per 100; 0/9 per doz.
..... New large-flowered Varieties, 5/6 per 100; 1/0 per doz.		

..... New large-flowered, "The Bride," flowers snow-white, very large and remarkably beautiful, per 100, 10/6; per doz., 1/6.

- ..... New large-flowered Intense Brilliant Scarlet, per 100, 5/6; 1/0 per doz.
- ..... New large-flowered Splendid mixed French Varieties, per 100, 7/6; per doz., 1/3.
- ..... Victoria Giant, a new race, with remarkably large flowers and brilliant colours, per 100, 10/6; per doz. 1/6.

ANEMONE STELLATA (THE STARRY WINDFLOWER OF THE RIVIERA).

These Starry-flowered Anemones are remarkable for variety of brilliant colours, elegant flowers, and graceful foliage. Those offered were selected by us from a very large collection; A. stellata are good pot-plants.

..... 3 each of 12 varieties .....	s. d.	7 6		..... Fine mixed, per 100, 12/6; per doz., 2/0
..... 1 each of 12 ,, .....		3 6		..... Mixed from the collection, per 100, 15/; per doz. 2/6

ANEMONE FULGENS (SCARLET WINDFLOWER).

This is the most brilliant and graceful of all Winter and Spring-flowering Anemones. The rich dazzling scarlet flowers, and light elegant growth, render it the most attractive scarlet flower of Spring. It is valuable for table bouquets or vases, as it lasts a long time in water. If the roots are planted early, flowers may be gathered from Christmas, and, by successional plantings, from August to May, a continued display is maintained till late in autumn. The plantings made for summer and autumn-flowering must be in a situation where in summer the ground is moist, and in shade, after 10 or 11 a.m.

..... Nemorosa bracteata fl. pl., white florets, resting on green bracts, ½ ft. per doz. 3s.6d.		0 4				

CYCLAMEN.

All the European Cyclamen are hardy, they require perfect drainage, and should be sheltered from the cutting winds of March and April, and the hot rays of the Summer sun; planted at the bottom of old walls and on rockwork, they are very beautiful; or nesting in the grass, near the roots and under the shelter of old trees, the effect is most charming. Europæum commences flowering in July; the Hederæfolium varieties follow in Autumn; Atkinsi, Ibericum, and Coum are Winter-flowering; Repandum and Vernum close the Cyclamen season in April. These hardy Cyclamen are beautiful pot plants when skilfully cultivated. See General Autumn Catalogue.

- ..... Cyclamen Europæum, we have these roots collected on the Alps. The flowers are delightfully fragrant, and the foliage beautifully variegated; it is a fine species either for rockwork, to plant at the bottom of old walls, to naturalize in the grass, or to plant in wild gardens. Ground roots, 25s. per 100; per doz., 4s. 6d.
- ..... Seed saved from the Large Flowered Prize Varieties of C. persicum, 1s. 6d. and 2s. 6d. per packet. Seedling plants, when properly cultivated, make fine specimens in about 12 months.
- ..... Cyclamen persicum, large-flowered varieties, for Greenhouse decoration, per doz., 15s., 21s., 25s., and 30s.; according to size, each, 1s. 6d., 2s., 2s. 6d., and 3s. 6d. Larger specimens, each, 5s. 6d., 7s. 6d., 10s. 6d., 12s. 6d., 15s., and 21s. Plants in flower can be supplied from December at market prices.
- ..... Hardy Cyclamen, Autumn, Winter, and Spring-flowering, assorted varieties, per doz., 12s. 6d. and 16s. 6d.

HYACINTHUS CANDICANS (THE GREAT SNOW-WHITE SUMMER-FLOWERING HYACINTH).

- ..... Hyacinthus Candicans is perhaps the most ornamental of summer-flowering hardy bulbs; it attains a height of 3 to 6 feet, according to soil and situation, and is surmounted with 20 to 50 graceful pendant bell-shaped flowers. It is equally decorative for the flower border and conservatory. Figured in *The Garden*, 1881. Flowering bulbs, per 100, 21/-, 30/-, and 42/-; per doz., 3/6, 4/6, & 5/6; each, 4d. & 0 6

GLADIOLUS RAMOSUS,

AND OTHER EARLY-FLOWERING GLADIOLI.

CULTURE.—Trench the ground, working in plenty of rotten manure in the underspit; plant the varieties of Colvilli, Cardinalis, and Byzantinus from the beginning of October, and the others from November till March, at a depth of six inches. If the summer is dry and the weather hot, a good soaking of water or liquid manure twice a week greatly benefits the growing plants.

CULTURE FOR CONSERVATORY DECORATION.—Plant three to five, according to the size of root, in a five or six-inch pot, and plunge in ashes in a cold frame or pit, and withhold water till the bulbs have started into growth; or, the pots may be buried in ashes out of doors, as recommended for the Hyacinth, and there allowed to remain undisturbed till ready to remove indoors. It is customary with some to plant several bulbs close together in the open border, and, when the flower begins to colour, lift without breaking the ball, pot, and place indoors. So treated, the flowers expand as if the bulbs had not been disturbed.

READY IN OCTOBER.

FRENCH VARIETIES OF GLADIOLUS GANDAVENSIS.

TIME OF PLANTING.—From the middle of April to the beginning of June we consider the best time to plant; when one planting only is made, we should recommend it being done early in May, but if successional plantings are made, commence middle of April, and continue fortnightly till the middle of June.

**THE LILIUM.**

**CULTURE OUT OF DOORS.**—The borders of Rhododendron and Azalea beds are generally suitable for Lily culture, as the necessary compost for the particular species can easily be given, and the shelter from the surrounding branches is beneficial in protecting the plants in spring, and affording a partial shelter from the sun's rays in summer; amongst dwarf shrubs, or herbaceous plants, and in the proximity of trees, the Lily makes the most satisfactory growth, if care is taken that there is always sufficient exposure so that the plants do not make a feeble growth. In the preparation of ground for Lilies, loosen the soil to a depth of several feet, and add fresh loam, coarse sand, good peat, or sweet decomposed leaf soil, care being taken that the soils are free as possible from insect life, and the compost sufficiently friable not to cling to the bulb. Plant the bulbs 6 inches deep, and if all things are equal they may remain undisturbed for many years. The bog or swamp-loving Lilies, Superbum, Canadense, and the varieties of Pardalinum require a moist peaty soil. Rockwork and artificial mounds, such as may be seen in the Edinburgh Botanic Gardens, are admirable for lilies, there being sufficient choice of aspects, soil, and drainage—thus the majestic bog-loving lilies would occupy the base with marsh plants, and the other species such positions as are best suited to them.

**CULTURE IN-DOORS.**—When grown in pots the Lily should have a compost of fibry loam and good peat, with plenty of sand, or sweet leaf soil and loam with sand, the bulb potted firmly, and the top covered at least two inches; this done, plunge the pots in ashes out of doors under a north wall, and there let the Lilies remain till they spear through the ashes, or, still better, till the flower buds are formed; at this stage remove to the conservatory, corridor, or sitting-room. Lilies in pots, when removed from the ashes, should have clear liquid manure twice a week. The drainage of the pots must be good, and no stagnant moisture tolerated in the plunging ground. Superbum, Canadense, and the varieties of Pardalinum, prefer moist sandy peat.

..... **Lilium Auratum**, in pots for late-flowering. These roots arrived from Japan in June, and were at once potted; at the present time (August) they give good promise of fine flower spikes,

**HELLEBORUS, OR CHRISTMAS AND LENTEN ROSES.**

In English gardens hardy plants are now fostered in permanent flower borders, and amongst them an honourable place is given to the decorative varieties of the Christmas and Lenten Roses, as the representatives of Winter flowers.

 *The Christmas and Lenten Roses are excellent pot plants, and well worth the attention of gardeners to grow on as specimen plants.*

**HERBACEOUS HARDY CHINESE PÆONIAS.**

These noble plants compete favourably in general effect with the finest hybrid Rhododendrons, whether it be in variety of tint, diversity of colour, profusion or duration of bloom.

**CULTURE.**—Trench the ground as deeply as possible, adding abundance of *rotten manure*, and in Summer, when convenient, give a plentiful supply of liquid manure. The Pæony may be planted in any position, but, considering that the flower buds are formed early in Spring, it is preferable to grow the plants where the sun's rays do not fall upon them till after 10 or 12 o'clock.
